SUMMARY

Full-Stack Software Development Engineer with ~2 years of experience building and shipping end-to-end features across the entire stack — from scalable backend APIs and real-time streaming systems to performant, production-grade UIs for enterprise data engineering platforms. Proficient across Vue 3, React, Node.js, Express, PostgreSQL/Prisma, and Redis, with hands-on experience taking features from API design to UI delivery in fast-moving, cross-functional teams.

EXPERIENCE

Modak Analytics LLP — Hyderabad, India

Software Development Engineer (Oct 2024 – Present) · Software Intern (Jun 2024 – Oct 2024)

ForgeAI — AI-first data engineering platform

Vue 3 · Composition API · Tailwind CSS · TypeScript · Node.js · Express · Redis · REST APIs · SSE

- Engineered a **multi-concurrent SSE streaming architecture** via a custom composable managing independent stream states per conversation, with **AbortController**-based cancellation — enabling parallel AI workflows and eliminating dangling connections on abort.
- Introduced **lazy loading and pagination** for conversation history, reducing initial load time by ~60% and improving perceived performance at scale across data-heavy views.
- Implemented **silent JWT token refresh interception** in the core API client and centralized request cancellation on logout — preventing session disruptions and eliminating post-logout state mutations from orphaned callbacks.
- Replaced client-side filtering with **backend search API integration** across a large inventory panel, improving search speed by 70% and result accuracy by 30%.
- Enforced **role-based read-only access** at both API and UI layers — disabling mutations for view-only users and maintaining permission boundaries across all shared resources.
- Closed a secrets security gap by adding **encrypted file-content secret support**, achieving **100% secure storage** across all secret types; engineered **SSE error differentiation** between network, auth, and AI-side failures — replacing generic errors with context-specific recovery messages.
- Shipped a **multi-filter configuration UI** with chip display and full create/edit/duplicate lifecycle; extracted a repeated sharing flow into a **reusable modal component** — eliminating duplication and standardizing UX across modules.

Modak Nabu — data engineering and pipeline orchestration platform

Vue 2 · Vue 3 · Vuex · View Design · Tailwind CSS · Go.js

- Developed a wide range of user-facing features using Vue.js, including **20+ configurable pipeline node types** (sources, destinations, executors, and REST API nodes) integrating with S3, JDBC, Hive, Salesforce, and 15+ other enterprise systems — driving backend Spark jobs through a visual configuration layer.
- Built an **interactive drag-and-drop graph interface** powered by Go.js, enabling users to visually construct data pipelines through node placement and live connection rendering between components.
- Developed **monitoring dashboards** surfacing real-time execution status, data transfer volumes, and historical job runs across hundreds of concurrent pipelines — giving users full operational visibility into their workflows.
- Created **reusable form components** to reduce dependency on external component libraries, improving design consistency and cutting development time on new features.
- Implemented **Tailwind CSS** with best-practice configuration, resulting in a **30% reduction in CSS bundle size** and faster page loads.
- Participated actively in code reviews, setting a benchmark for best practices and ensuring strong code coverage across the team.

PROJECTS

Smart Meeting Notes Platform — *React, Express, PostgreSQL, Prisma, Redis, BullMQ*

- Designed and built a full-stack platform for automated meeting transcription, summarization, and action item extraction, with a React + Vite frontend and Node/Express REST API backend.

- Architected an asynchronous audio processing pipeline using **Redis + BullMQ** for transcription job queueing, decoupling upload-time latency from compute-heavy processing.
- Implemented **JWT authentication with refresh tokens** and role-based route protection across both client and server, backed by a normalized PostgreSQL schema (Prisma migrations) covering users, meetings, transcripts, and action items.

StreetGuard — Urban Infrastructure Issue Reporting System — *MERN, Mapbox, Cloudinary* · [GitHub](#)

- Built a full-stack MERN web application enabling citizens to report urban infrastructure issues (potholes, damaged roads, flooding) with image uploads, geotagged locations, and user-assigned urgency ratings.
- Integrated **Mapbox API** for geospatial visualization of reported issues on a responsive map and **Cloudinary** for image storage and CDN delivery.
- Implemented an issue lifecycle tracking system (reported → verified → in-progress → resolved) with transparent status updates for citizens and administrative validation tools for authorities.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, SQL, HTML/CSS, C/C++, Java

Frontend: Vue 3, React, Tailwind CSS, View Design (iView UI), Vite, Bootstrap

Backend: Node.js, Express, REST APIs, JWT Authentication

Databases & Infra: PostgreSQL, Prisma, MongoDB, Mongoose, Redis, BullMQ

Tools & Services: Git, GitHub, VS Code, Postman, Mapbox, Cloudinary, AWS

EDUCATION

Mahatma Gandhi Institute of Technology, Hyderabad

B.Tech, Computer Science Engineering · CGPA: 8.3 · 2020 – 2024

CERTIFICATIONS

- Full Stack Web Developer Bootcamp
- Database Programming with SQL — Oracle
